

NASA GRANT NAG-1-1755 (033734) FINAL REPORT

Period of award: 10/1/95 – 9/30/98 with no-cost extension through 2/28/00

PI Name: Mary Anne Carroll

PI Institution: University of Michigan

PI Address: Department of Atmospheric, Oceanic, and Space Sciences, 2455 Hayward
(Rm 1518 SRB), Ann Arbor, MI 48109-2143

Participants

*Mary Anne Carroll, PI

*George Albercoock, Post-doc, Assistant Research Scientist

*Louisa Emmons, Post-doc

*Troy Thornberry, Graduate Student

*Alexei Markovitch, Graduate Student

*Dezhang Chen, Graduate Student

**Randall Higgins, REU, Summer 1995

***Richard P. Schuster (Paul), REU, Summer 1995

***Inder Singh, REU, Summer 1996

***Anish Goel, REU, Summer 1996

*Steven Musko, Systems Engineer

*Ronald Rizer, Electrical Technician

•supported by this grant

**supported by NSF REU Site Grant to UM Chemistry Department

*** supported by NSF REU Site Grant to UM AOSS Department

SUMMARY

Fabrication of the University of Michigan Multichannel Chemiluminescence Instrument (UMMCI) was completed in early 1996 and the instrument participated in test flights on the NASA P3B at Wallops Island prior to integration and deployment for the PEM-Tropics A Mission. The UMMCI consists of 4 channels for simultaneous measurements of ozone and NO with the option for measurements of NO₂ and NOy (total reactive nitrogen) when converters are placed upstream of the NO channels. Each NO channel consists of a zeroing volume and reaction vessel, while the ozone channel consists of an ozone catalyst (or scrubber) trap that is not in line with the reaction vessel. The detectors in all four channels are Hamamatsu photomultiplier tubes, which are followed by pulse amplifier discriminators on the NO channels and an electrometer on the ozone channel. Schematics of the Detector Module and NOx/O₃ Probe Insert and Diagrams of the Control and Data System, the Power and Ground System, the Gas Flow System, and the Calibration System Flow are attached.

Intercomparisons were conducted with G. Gregory, NASA/Langley, during the test flights (following prior calibration of the ozone generator/calibrators at the Wallops Long-Path Absorption facility). Initial test results appeared to be reasonable, and instrument characterization studies proceeded for the ozone channel and the 3 NO channels until deployment for integration for the PEM-Tropics Mission.

Ozone data was obtained for Flights #4, and 6-21, and finalized data was submitted to the PEM-Tropics Data Archive and to the Science Team during the April 1997 Data
